Hood Wolves White Paper

Compiled from the official launch infographic and public project materials

Version 1.0 — September 2026

Two collections. One market. Holders earn.
Let your wolf work for you.

Hood Wolves is the evolved form of the Ape Cubz collection. Holders lock two Cubz to reserve one guaranteed Hood Wolf mint. The collection launches as a 3,333-supply pixel PFP on Robinhood Chain, minted omnichain via Unvault, with immediate utility through the $HOWL token and the Anvil AMM.

The design is simple: own Cubz or Wolves, acquire $HOWL, burn a portion to clock in the NFT, and earn a share of trading fees generated by both collections on a single shared market. Liquidity is locked at launch, proceeds splits are automated and on-chain, and reactivation is required on transfer so value stays tied to active holders.

This document restates the full launch sequence, mint schedule, proceeds split, utility loop, tier system, and economic facts published in the project's launch visual.

1. Vision

The Cubz have outgrown Emberwood. Under a red moon they take the hood, leave ApeChain, and hunt as a pack on Robinhood Chain (chain ID 4663, ETH gas).

The project's stated goal is not another static PFP. It is to give two collections a shared reason to trade: Cubz remain on ApeChain; Wolves live on Robinhood Chain; both feed one $HOWL market on Anvil. More trading produces more fees; more fees produce more $HOWL for clocked-in holders.

Tagline from the launch materials: *Built for the pack. Built to last.*

2. The Two Collections

Collection	Chain	Role	Key Ratio
Ape Cubz	ApeChain	Origin collection; GTD access key	2 Cubz = 1 GTD Wolf mint
Hood Wolves	Robinhood Chain	Evolved collection; primary utility NFT	1 Wolf = 100,000 $HOWL base value

Wolves can conceptually return to Cubz and grow back into wolves. Cubz locked for GTD can be unlocked and returned to ApeChain until the claim window freezes.

Art direction: same 8-bit soul — night woods, yellow moon, wolves on the hunt. Artwork credited in public posts to @ukdeadstock; collabs referenced with @_alienkid.

3. Launch Sequence (The Rollout)

The official seven-step sequence is:

01 — GTD Access
Cubz holders lock 2 Cubz = 1 GTD mint. Lock box is live on HoodWolves.com. Ratio displayed as 2 : 1.

02 — Unvault Mint
Paid mint goes live on Unvault. Price: TBC.
Available: 2,667 Hood Wolves.
666 of those are automatically seeded to the Anvil AMM marketplace.

03 — Mint Completes
Public mint concludes. Final supply: **3,333**.

04 — Deploy Anvil Market
Anvil AMM platform goes live. Trading, fees, and vault mechanics activate.

05 — Seed Anvil Inventory
666 Hood Wolves + 333 Ape Cubz seeded into Anvil AMM inventory.

06 — Deploy & Lock $HOWL Liquidity
12.5% of mint proceeds provide $HOWL liquidity. LP is locked permanently. No team access.

07 — $HOWL + Clock-In + Rewards Live
$HOWL token live. Clock-in utility active. Rewards system goes live.

4. Mint Schedule

Minting is omnichain, powered by Unvault. Users mint from anywhere and receive the NFT across multiple supported chains.

Phase	Description	Access
1. Unvault Mint	Available on Unvault across GTD, FCFS and public phases. Price TBC.	All phases
2. GTD (Guarantee	Early access for community first.	Cubz holders (lock 2 Cubz = 1 GTD), Genesis Bugz holders, Partners, Allowlist
3. Public	FCFS after GTD window ends.	Open
4. Total	3,333 Hood Wolves	—

Every mint is automatically split (see Section 5).

5. Mint Proceeds Split (Automated & Transparent)

Allocation	Percentage	Destination / Notes
Unvault fee	10%	Platform fee
$HOWL liquidity	12.5%	Automated, omni-chain, verifiable. Reserved for SHOWL LP
Remaining proceeds	Balance	Ecosystem Treasury

Treasury uses (as listed): Anvil operations, marketing, rewards, NFT buybacks, future development, liquidity.

Liquidity & launch plan

- 12.5% of mint proceeds automatically reserved for $HOWL LP.
- LP funds automatically deployed to create a SHOWL/ETH LP at mint sell-out.
- LP locked permanently. No team access.

- Transparent omni-chain tracking and verifiable allocation.

6. How the Utility Works

Simple actions. Real rewards.

1. Own Cubz or Wolves.
2. Get $HOWL (acquire tokens).
3. Burn 10,000 $HOWL to activate.
4. Clock in your NFT (unlocks reward eligibility).
5. Unlock rewards from the ecosystem.

Both collections feed **one** $HOWL market on Anvil:

Ape Cubz → trades & fee pool → Hood Wolves

More trading = more fees = more $HOWL for clocked-in holders.

Fees pay Wolf holders automatically: more volume → bigger fee pool → revenue share credited to the holder's Robinhood NFT wallet. No extra steps.

7. $HOWL + Anvil Economics

Base activation (Clock-In)

- Cost: 10,000 $HOWL (10% of base value).
- Burns ~9,500 $HOWL (95%).
- Unlocks rewards.

Higher tiers (optional)

Tier	$HOWL Burned	Multiplier
1	22,000	1.25x
2	45,000	1.6x
3	90,000	2x
4	240,000	3.33x

Every $HOWL transaction, NFT AMM swap, and $HOWL burn feeds the pool.

Anvil fee flow (holders earn)
Trades & swaps → Fee pool → Revenue shares to holders.

8. Key Economic Facts

- 1 NFT = 100,000 $HOWL base value (**not claimable**).
- Base activation = 10,000 $HOWL (10%).
- ~95% of activation $HOWL is burned.
- Re-activation required on transfer (resets).
- Fees go to holders via revenue shares.

9. Technical Stack (as stated)

- **Mint & delivery:** Unvault (omnichain minting and marketplace).
- **Market & liquidity:** Anvil AMM (Clutch Markets / Anvil).
- **Home chain for Wolves:** Robinhood Chain (ID 4663).

- **Origin chain for Cubz:** ApeChain.
- Lock box and holdings checker live at hoodwolves.com.

10. Closing Statement

The launch visual ends with the same two lines that open this paper:

Two collections. One market. Holders earn.
Let your wolf work for you.

Disclaimer

Token prices, mint price, dates, and smart-contract addresses are TBA. Always verify contracts, lock status, and current mechanics on official channels (hoodwolves.com, Unvault, Anvil) before interacting. Cryptocurrency and NFT markets are high risk. DYOR.
